

On the eve of the celebration of the Day of Science and Cosmonautics, a lecture was held on the most important modern projects of Russian cosmonautics, which are related both to the study of near-Earth space and to the study of other objects in the solar system and even the entire universe.

The senior lecturer of the department, PhD, Bazarbek Asyl-Dastan spoke about the key moments in the history of domestic cosmonautics: the first flights into space, orbital stations, the history of interplanetary research and other important events and achievements, without which modern research outside the Earth is impossible.

At the end of the report, students and guests asked their questions and exchanged their knowledge and opinions on the prospects for Russian cosmonautics.
